

ContentFlow AI

Complete System Flow for Final Year Project Presentation

Organization	Digital Bee / digitalbee.ai
System Type	AI-assisted digital content production management system
Main Users	Admin, Staff / Editor, Manager / Client
Main Output	UGC videos, highlight clips, final MP4 media library, project analytics

This document illustrates how ContentFlow AI manages client campaigns, AI-assisted video generation, automatic clipping, media review, and analytics in one production workflow.

1. Complete System Flow

The system begins with client and campaign setup, then branches into two production workflows: AI Generator and Auto Clipper. Both workflows end in review, media library storage, and analytics.

Workflow A: AI Generator / UGC Reference Replication

Workflow B: Auto Clipper / Highlight Generator

2. User Role Flow

ContentFlow AI supports three practical user groups. Each group has a different dashboard responsibility, which makes the system suitable for real production teams and client-facing review.

Role	Main Responsibility	Example Module
Admin	Creates clients, campaigns, projects, folders and assigns staff or reviewers.	Project Management Dashboard
Staff / Editor	Produces AI UGC videos or clipping outputs and submits them for review.	AI Generator / Auto Clipper

Manager / Client	Views final media, approves work, requests changes and monitors campaign progress.	Media Library / Analytics
------------------	--	---------------------------

3. Why This System Aligns With FYP Criteria

Criteria	How ContentFlow AI Matches
Real Organization	The system is designed for Digital Bee, a real startup workflow that handles client content production.
Real Problem	Content teams need to manage many client projects, reference assets, generated videos, clipping tasks, review status and final outputs.
Web Application Module	Admins and managers use the web dashboard for clients, campaigns, projects, approval, media library and analytics.
Mobile App Potential	Staff or clients can later use a mobile module for quick upload, review notifications, approval decisions and media preview.
Database Backend	The data model can be implemented with MySQL, Firebase or Supabase using entities such as users, clients, campaigns, projects, media assets and approvals.
Data Analysis	The system collects measurable data: project count, render count, approval status, staff workload, campaign output and content production progress.
Faculty Filter	It is not a rental system, booking system or rebranded senior project. It is a digital content production management system with AI workflow automation.

One-sentence explanation: ContentFlow AI is a web-based production management system that helps Digital Bee manage client campaigns from project assignment to AI-assisted video creation, editing, approval, media storage and analytics.
